$8^{\text {th }}$ grade $\quad$ Task $2 \quad$ Squares and Rectangles

| Student <br> Task | Use the properties of shapes to find similar shapes. |
| :--- | :--- |
| Core Idea <br> Geometry <br> Gad <br> Measurement | Analyze characteristics and properties of two- and three- <br> dimensional geometric shapes; develop mathematical arguments <br> about geometric relationships; apply transformations and use <br> symmetry to analyze mathematical situations; and apply <br> appropriate techniques tools, and formulas to determine <br> measurements. <br> $\bullet$ <br> Understand relationships among the angles, side lengths, <br> perimeter, and area of similar objects |
| -Describe sizes, positions, and orientations of shapes under <br> informal transformations such as flips, turns, slides, and <br> scaling. |  |
| Core Idea <br> $\mathbf{2}$ <br> Mathematical <br> Reasoning | Employ forms of mathematical reasoning and justification <br> appropriately to the solution of a problem. <br> Formulate conjectures and test them for validity |

Eighth Grade - 2003

## Squares and Rectangles

This problem gives you the chance to:

- use properties of shapes
- use coordinates

1. What specific properties must a quadrilateral have in order to be a rectangle?
$\qquad$
$\qquad$
2. What specific property must a rectangle have in order to be a square?

On this grid, the Xs indicate two corners of a square.

There are three different ways to draw a square with these Xs as two of its corners.
3. Draw the three squares on the grid.
4. Write the coordinates of the corners of the three squares.

Square $1 \quad(\quad, \quad)(\quad)(\quad, \quad)(\quad, \quad)$
Square $2(\quad, \quad)(\quad, \quad)(\quad, \quad(\quad, \quad)$
Square $3 \quad(\quad, \quad)(\quad)(\quad, \quad)(\quad, ~)$

The points marked by Xs on this grid indicate two corners of a rectangle. Suppose that the area of each square on the grid is $1 \mathrm{~cm}^{2}$.

5. On the grid above, draw a rectangle with two of its corners on the Xs. Your rectangle should have a width to height ratio of $2: 3$.
6. What is the area of your rectangle?
7. How many different rectangles can be drawn on the grid using the points marked by Xs as corners?

Explain your reasoning.
$\qquad$
$\qquad$

## Squares and Rectangles

| The core elements of performance required by this task are: <br> - use properties of shapes <br> - use coordinates <br> Based on these, credit for specific aspects of performance should be assigned as follows: | Points | ${ }_{\text {S }}^{\substack{\text { Section } \\ \text { Points }}}$ |
| :---: | :---: | :---: |
| 1. Gives correct answers as: <br> The corners must be right angles. | 2 | 2 |
| 2. Gives correct answer as: <br> The sides must be all the same length. | 1 | 1 |
| 3. Draws three correct squares on the grid with corners on the X s. <br> Partial credit: <br> Draws two correct squares: 2 points <br> Draws one correct square: 1 point | 3 <br> (2) <br> (1) | 3 |
| 4. Gives correct coordinates as: <br> Square $1(5,4)(5,8)(9,8)(9,4)$ <br> Square $2(5,4)(9,4)(9,0)(5,0)$ <br> Square $3(5,4)(7,6)(9,4)(7,2)$ <br> Partial credit: <br> Gives correct coordinates for two of the three squares: 2 points Gives correct coordinates for one of the three squares: 1 point | 3 <br> (2) <br> (1) | 3 |
| 5. Draws correct rectangle with corners at (5,10) $(9,10)$. | 1 | 1 |
| 6. Gives correct answer as: $24 \mathrm{~cm}^{2}$ | 1 | 1 |
| 7. Gives explanation such as: <br> 12 or 13 (thinking of how many can be drawn on this grid with other two corners on grid-points) <br> or <br> As many as you like because the height of the rectangle can be any size - the grid can go on forever and/or other two corners do not have to be on grid-points. <br> or <br> Correctly considers rectangles with ratios 2:3. | 1 or 1 or 1 | 1 |
| Total Points |  | 12 |
